Project Design Phase
Solution Architecture

Date	08/04/2026
Team ID	SWTID-2026-6888
Project Name	Streamlining Ticket Assignment for Efficient
Maximum Marks	

Solution Architecture:

The proposed solution automates and optimizes ticket assignment by first ingesting tickets from multiple sources such as email, chatbots, web forms, and support portals, then preprocessing the data to clean and standardize it.

Features

- **Automated Ticket Classification:** Categorizes incoming tickets using NLP (technical, billing, general queries).
- **Priority Assignment:** Assigns urgency levels based on content, customer type, and SLA requirements.

Development Phases:

Requirement Gathering: Understand current ticketing process, pain points, and SLA requirements.

Design & Architecture: Define system architecture, data flow, and AI assignment strategy.

Solution Requirements

- Integration with existing ticketing systems.
- Real-time dashboards and SLA alerts.

Specifications

- **Structure:** Modular architecture with separate layers for ingestion, processing, assignment, and monitoring.
- **Characteristics:** Scalable, automated, intelligent, real-time, and easy to integrate
